

ABSTRACT OF THE DISCLOSURE:

The significant difference that this present invention has compared to prior art is in its individual containers and compartments. These individual containers allow caregivers to differentiate between each infant's dietary constraints. It attempts to simplify the feeding process by providing a method for preparing multiple bottles mechanically. Another benefit comes from the devisee's ability to release each container from its housing so that it may be properly sanitized. The containers may also be brought home, so that parents do not have to worry about leaving formula at their day-care center, where it might be given to another infant. The container can be brought to the day-care center like a child brings his or her lunch box to school. Once there, it can be reinserted and provide a full day's nourishment.
